Background in symplectic and contact geometry

1. Symplectic geometry

$$\frac{\text{Ex.}}{M_{i}\omega} = (IR^{2m} \ \omega_{sta} = \sum_{i=1}^{n} dx_{i} \wedge dy_{i}')$$

$$(M_{i}\omega) = (C^{n} \ \omega_{sta} = \frac{\sqrt{-1}}{2} \sum_{i=1}^{n} dz_{i} \wedge dz_{i}')$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega) = (T^{*}Q, \ \omega_{can} = \sum_{i=1}^{n} dq_{i} \wedge dp_{i}'$$

$$(M_{i}\omega$$

All cases above are exact: $w = d\lambda$ for some $\lambda \in \mathcal{N}(M)$

$$E_X$$
 $(M, \omega) = (290, \omega_{area})$
 $(M, \omega) = (D^n, \omega_{FS})$ Fubrui-Study form

a symp str in local charts.

$$\frac{\sum_{k} \left(M_{k} \omega_{k}\right), \left(N_{k} \omega_{k}\right)}{\left(N_{k} \omega_{k}\right)} = \frac{\left(M_{k} N_{k} \omega_{k}\right)}{\left(M_{k} N_{k} \omega_{k}\right)} = \frac{1}{100} \frac{1$$

(M, J) almost cpx str. when Jp: TpM S a linear map (+, J=-17pm

Ex Any complex wild (M, i) is an almost epx str b/c locally

 $i \cdot z = \sqrt{-1 \cdot z}$ identified $\int_{\Gamma} (x_1, y_1, \dots, x_n, y_n) = (y_1, -x_1, \dots, y_n, -x_n)$ easy matrix

In general, I could be much more compliated.

Ruk In general, to check if I is included by a cpr str, we apply Newlander-Nivenberg criterion. > on &, any almost epx is a epx str.

Notation. (2g, j) a Riem surface.

Relations extreen different germetries.

- They subset-untaining is strict.
- Tor cany (M,w), 3J what is w-compatible. . W(V,JV) >0

 - · w(v, w) = w(Jv, Jw)

Then (Gromov) $J(M_{i}w) = \{ w - compatible e.c.s J u m \}$ is contractible (and won-empty).

Ruk The same conclusion holds for

Jr (Mrw):= {a.c. J m My that satisfies the second condition of (*) } Second condition of (*) J is w-tamed.

RMK The Esymp. & & Cla.cs is the key to bring symp. geo to a.c. geometry, where techniques in complex geo can apply.

 (M, ω) , $H: [01] \times M \to \mathbb{R}$, um-dig of ω implies $\exists X_H \leftarrow t$. $\omega(X_H, -) = -dH$ Hawi Howan vector field.

(S², warra) H

H:S² -> IR

autonomous, height fen

XH = 5 -> which is I to the gradient vector-fred

) dyn or geo meaning of XH is more mysterious.

For dyn, one aims to ctudy closed vobits of Xx: D: S'= 18/2 $\longrightarrow \mathcal{M}$ s.t. $\dot{\mathcal{F}}(t) = X_{H}(\mathcal{F}(t))$

{ closed orbits of XH} = 1:1 } { fixed ptr of the time-1 map of the } + 1 more of the }

PH flow (i.e. det = XH(PH)) Homistonian flow Y = Q' E Diff (M) Hawittana differ

Obcenations.

- P preserves w Ptw = w (=) & preserves volume of M
- · There could be other for Grs.t. Pare p. Prototo
- · } Q= QH for some H} = Difful (M).

 Hint: (T. wavea)

→ 4 & Ham (M, w) is more special and it reneals some rigidities in Symp geo.

They (Arnold cory) For any QE Ham (M, w), under some non-deg, # Fix (4) > 5 b: (M; Zz) & betti number.

Ruk Lefschetz fixed pt Thun gives an alternating sum.

w spup struceded!

Id Given (Σ,j) , (M,J), a J-hol cure is $u.(\Sigma,j) \rightarrow (M,J)$ satisfying

J. Ux = Ux.j

One can also unite Ux + J. Ux = = 0 = introcluce a notation of by

Ju = = (u* + J. u*)

Then u is J-hol iff u = 35-1(0). We will make this more rigorous later.

Due can study J-hol from various perspectives, worstly split into the following two:

· local properties of I lw/ cures

 $Ex \quad U, \quad U \quad \text{are } J-hol \quad \text{curve} \quad (\Sigma,j) \longrightarrow (M^4, \, 5) \, . \quad \text{Denste}$

A = [Im(u)] B = [Im(v)] and $A \neq B$ in $H_2(M; Z)$

If they are simple (not multiple cover), then

OA.B > # {(2,2) @ Ex E | U(20) = V(21)}

(3) A·A > # 5(20,21) & Ex E \ D \ (U(21) = U(21) \ + C,(A) - X(E)

O is called positivity of intersection ccf. the same conclusion for hol cremes in a cpx what).

In a local coordinate of Σ , (s,t) s.t. $j \ge 2 + 1 = -2s$. $\overline{J}(u) = \frac{1}{2} (\partial_s u + \overline{J}(u) \partial_t u) ds + \frac{1}{2} (\partial_t u - \overline{J}(u) \partial_s u) dt$

0 = N+6 (W) T +N 26 Hi 0= (N) TG (E

Min univertely, if (Σ,j) and (M,J) are locally modelled by (Γ,i) , then $\overline{\mathcal{I}}(u)=0$ if u satisfies Cauchy-Rrem eqn.
